

Have You or Someone You Know Suffered a Heart Attack 1 to 3 Years Ago?

Having a heart attack can have a big impact on your life. If you or someone you know has had a heart-related event, you may be eligible to participate in a clinical research study of an investigational medication.

There is a clinical research study evaluating an investigational antiplatelet medication for long term treatment in adults 50 years and older who suffered a heart attack 1 to 3 years ago and have at least one of the following risk factors:

- Age 65 or older
- Diabetes mellitus requiring medication
- Documented history of a second prior MI
- Multi-vessel coronary artery disease
- Chronic non-end stage renal dysfunction

Approximately 21,000 patients will take part in this study globally. On average, patients will participate in the study for approximately 26 months. Study visits will take place every 4 months for the first year and then every 6 months thereafter.

Medication during the study will be provided to qualified participants at no charge.

During your time in the study, you will continue to see your regular doctors. To find out more about the opportunity to participate in this clinical research study, please contact:
